Cadastre

Greek cadastre tools for AutoCAD, Civil 3D, ZWCAD and GstarCAD — user manual

Cadastre adds a **Cadastre** tab to the ribbon. It loads cadastral parcels (with their KAEK) and forest maps from the Greek open data of **data.gov.gr**, places a satellite image behind the drawing, converts coordinates between ΕΓΣΑ87 and WGS84, and draws coordinate grids. Every button can also be typed as a command.

Before you start

- **Programs:** AutoCAD or Civil 3D 2021–2026, ZWCAD 2026 or GstarCAD 2027 (Professional editions; LT versions cannot load plugins).
- **Drawing coordinates:** the drawing must be in **ΕΓΣΑ87** (EPSG:2100), in metres.
- **Internet:** needed the first time a region is used. Downloaded files are kept in `%LOCALAPPDATA%\GeoCore` and reused, so later runs are fast and work offline.
- **Your property:** draw it as a closed polyline on layer `TOPO_PROP`, or select any closed polyline when asked.

Commands

Command	What it does
KDOMORA	**Load parcels and neighbours.** Select a polygon (a parcel or your property) or press *Enter* to use `TOPO_PROP`. Choose the source: *Online* (data.gov.gr — the region is found automatically and downloaded once) or *Arxeio* (an official κτηματογραφικό απόσπασμα, DXF/DWG). The parcels under the property and their neighbours (όμορα) are drawn on layer `PST_KAEK` with their KAEK, and the view zooms to them.
KDDASIKA	**Forest map.** Select the property (or *Enter* for `TOPO_PROP`) and choose the map: *Kyromenos* (ratified), *Anartimenos* (posted) or *Istorikos1945*. The forest polygons around the property are drawn on layers `DX_...`, labelled with their category (ΔΔ, ΑΔ, ΔΑ, ΑΑ, ΧΧ ...), and the command lists how much of the property falls in each category.
KDMAPON	**Satellite image on.** Places an Esri World Imagery picture behind the drawing (layer `ORTHO_ESRI`). It follows the view: after you pan or zoom, a new image is loaded. No account is needed.
KDMAPOFF	**Satellite image off.** Removes the image from the drawing.
KDGRT	**ΕΓΣΑ87 ↔ WGS84.** Click a point to see its ΕΓΣΑ87 and WGS84 (φ, λ) coordinates, or type *Geo* and enter `ϕ,λ` in decimal degrees (e.g. `37.9755,23.7348`) to place that point in the drawing.
KDSCALE	**Drawing scale** (e.g. 500, 1000, 2000). Sets text height and linetype scale for the other commands. Saved in the drawing.
KDGRID	**Coordinate grid.** Pick two corners and accept (or change) the grid spacing. Crosses with their coordinates are drawn on layer `KT_GRID` at the drawing scale.
KDHELP	Opens this manual.

KDABOUT	About the tool and its author (ribbon button Σχετικά).
CADASTRE	Shows the Cadastre ribbon tab again if it has disappeared (e.g. after changing workspace).

A typical job

1. Open or create a drawing in ΕΓΣΑ87 and draw the property on `TOPO_PROP`.
2. `KDSCALE` — set the scale of the final drawing.
3. `KDMAPON` — check the property against the satellite image.
4. `KDOMORA` — load the parcels and their neighbours with KAEK.
5. `KDDASIKA` — check whether the property touches forest land.
6. `KDGRID` — add the coordinate grid; `KDMAPOFF` before plotting if you do not want the image.

Important notes

> **Open data is not an official extract.** Parcels from data.gov.gr may differ by a few centimetres from the official κτηματογραφικό απόσπασμα and some areas are not yet published. For submissions to the Κτηματολόγιο use the official extract (`KDOMORA` → *Arxeio*).

> **The satellite image is for orientation only.** It can be a few metres off. Imagery © Esri, Vantor, Earthstar Geographics and the GIS User Community.

- Coordinate conversion uses the standard ΕΓΣΑ87 ↔ WGS84 parameters (accuracy about 1 m) — not for HEPOS-grade work.
- Forest map and parcel files are large (100–360 MB per region). The first download of a region takes a few minutes; a progress window lets you cancel it.

Installing and removing

- Run **Cadastre-Setup.exe** with AutoCAD / Civil 3D / ZWCAD / GstarCAD closed. It finds the installed programs and sets Cadastre up for each of them. No administrator rights are needed.
- Start the program: the **Cadastre** tab appears on the ribbon.
- To remove it: Windows *Settings* → *Apps* → *Cadastre* → *Uninstall*.

Troubleshooting

Problem	Solution
The tab is missing	Type `CADASTRE`. If the command is unknown, close the program and run the setup again.
“Outside Greece” / nothing found	The drawing is not in ΕΓΣΑ87, or the area is not in the open data yet.
Download fails	Check the internet connection and try again; finished downloads are kept.
Running out of disk space	Delete region folders in `%LOCALAPPDATA%\GeoCore`; they are downloaded again when needed.
